

Today, Jan 21: work on finishing ch 12

Tomorrow: expt 1, problem club with Ali

Wednesday: finish 12, start 13

hydrocarbons		bp
CH ₄	methane	CH ₄ -164°C
C ₂ H ₆	ethane	CH ₃ CH ₃ -89°C
C ₃ H ₈	propane	CH ₃ CH ₂ CH ₃ -42°C
C ₄ H ₁₀	butane	CH ₃ CH ₂ CH ₂ CH ₃ -1°C
C ₅ H ₁₂	pentane	CH ₃ CH ₂ CH ₂ CH ₂ CH ₃ 36°C

} increases due to more London dispersion forces

alcohols		bp
$\begin{array}{c} \text{H} \\ \\ \text{H}-\text{C}-\text{OH} \\ \\ \text{H} \end{array}$	methanol	CH ₃ OH +65°C
$\begin{array}{c} \text{H} \quad \text{H} \\ \quad \\ \text{H}-\text{C}-\text{C}-\text{OH} \\ \quad \\ \text{H} \quad \text{H} \end{array}$	ethanol	CH ₃ CH ₂ OH +78°C
$\begin{array}{c} \text{H} \quad \text{H} \quad \text{H} \\ \quad \quad \\ \text{H}-\text{C}-\text{C}-\text{C}-\text{OH} \\ \quad \quad \\ \text{H} \quad \text{H} \quad \text{H} \end{array}$	propanol	+83°C
CH ₃ CH ₂ CH ₂ OH	butanol	+117°C
C ₅ H ₁₁ OH	pentanol	+138°C

} higher due to hydrogen bonding

CuSO₄ (aq)

• Cations make ion-dipole interactions in water

$\text{CH}_3\text{OH} + \text{H}_2\text{O}$ miscible (mixes)
 ethanol + H_2O miscible
 propanol + H_2O miscible
 butanol + H_2O 73g butanol / L H_2O (not totally miscible)

$\begin{array}{c} \text{-C-C-C-C-OH} \\ \underbrace{\quad\quad\quad}_{\text{non-polar}} \quad \underbrace{\quad\quad\quad}_{\text{H-bonding}} \end{array}$

pentanol + H_2O 22g pentanol / L H_2O

What is the vapor pressure of a solution made by dissolving 40.0g $\text{C}_{12}\text{H}_{22}\text{O}_{11}$ (MM=342g/mol) in 100g H_2O at 23°C?

$$P_{\text{sol'n}} = X_{\text{solvent}} \times P_{\text{solvent}}$$

	<u>m</u>	<u>n</u>
$\text{C}_{12}\text{H}_{22}\text{O}_{11}$	40.0g	0.117mol
H_2O	100.0g	5.55mol

$$P_{\text{sol'n}} = \frac{5.55\text{mol}}{0.117\text{mol} + 5.55\text{mol}} \times 21.0\text{mmHg}$$

$$P_{\text{sol'n}} = 20.57\text{mmHg}$$

Colligative properties of solutions change physical properties based on the amount of solute present

* non-electrolyte = not ionic (does not dissociate)
 urea does not dissociate NaCl does dissociate
 1 mol urea \approx 1 mol particles 1 mol NaCl \approx 2 mol particles

Therefore for colligative properties mole fraction (x) can change...

$$x = \frac{n_{\text{solvent}}}{n_{\text{solvent}} + i n_{\text{solute}}}$$

$i = 1$ for covalent molecules

$i = 2$ for NaCl

$i = 3$ for N_2SO_4

↑
van Hoff factor (depends on dissociation)

• What is the vapor pressure of a solution containing 0.24 mol NaCl in 5.00 mol H_2O at 21°C ?

$$P_{\text{sol'n}} = \frac{5.00 \text{ mol}}{5.00 + 2 \times 0.24 \text{ mol}} \times 18.8 \text{ mmHg}$$

$$P_{\text{sol'n}} = 17.15 \text{ mmHg}$$

Vapor pressure:

- non-volatile solute (probably has very low vapor pressure):

↳ non-electrolyte: $P_{\text{sol'n}} = x_{\text{solvent}} \times P_{\text{solvent}}$

↳ electrolyte $P_{\text{sol'n}} = \frac{n_{\text{solvent}}}{n_{\text{solvent}} + i n_{\text{solute}}} \times P_{\text{solvent}}$

- solute with vapor pressure (l+l):

$$P_{\text{sol'n}} = x_{\text{solute}} \times P_{\text{solute}} + x_{\text{solvent}} \times P_{\text{solvent}}$$

Freezing point lowering

$$\Delta T_f = K_f \times m \times i$$

↑ ↑ ↑
constant molality Van Hoff factor

What is the f_p/m_p of a solution containing 5.7g NaCl in 55g H_2O ? $K_f = 1.86 \frac{\text{deg}}{\text{molal}}$ $MM_{NaCl} = 58.5 \text{g/mol}$

1.76 molal

$$\Delta T_f = 1.86 \frac{\text{deg}}{\text{molal}} \times \cancel{0.0974 \text{ molal}} \times 2$$

$$\Delta T_f = \cancel{0.36 \text{ deg}} \quad 6.6 \text{ deg}$$

Normal freezing point = 0°C

New freezing point = -0.36°C -6.6°C

Boiling point elevation

$$\Delta T_b = K_b \times m \times i$$

for H_2O , $K_b = 0.51 \text{ deg/molal}$

$$\Delta T_b = 0.51 \text{ deg/molal} \times 1.76 \text{ molal} \times 2$$

$$\Delta T_b = 1.81 \text{ deg}$$

Normal boiling point = 100°C

New boiling point = 101.81°C

Suppose 4.77g unknown non-electrolyte is dissolved in 50.0g H_2O . The $f_p/m_p = -2.40^\circ\text{C}$. What is the MM?

$$\Delta T_f = K_f \times m \times i$$

$$2.40 \text{ deg} = 1.86 \frac{\text{deg}}{\text{molal}} \times 1 \times m$$

$$1.29 \text{ molal} = m$$

$$1.29 \text{ molal} = \frac{n_{\text{unk}}}{m_{H_2O} (\text{kg})} \times 1.29 = \frac{n}{0.05 \text{ kg}}$$

$$n = 0.0645 \text{ mol}$$

$$MM = \frac{4.77 \text{ g}}{0.0645 \text{ mol}}$$

$MM = 73.95 \text{ g/mol}$
